- About the data provided by J-Quants API
- About Market API Developer Community

(NOT today's topic)

- Specific examples of analysis using J-Quants API
- Example of analysis in Numerai Signals using J-Quants API

- Retail investors make up a large proportion of the trading volume on Japanese markets. Japan Exchange Group (JPX) considers it an important part of its responsibility as a market operator to help equip these investors with the tools they need, as well as to widen the pool of potential investors, through financial and economic education programmes.
- As part of this, JPX Market Innovation & Research, Inc. (JPXI), a new subsidiary of JPX established in April this year, is leveraging technology to provide an innovative educational program, the J-Quants project.
- This program offers retail investors a taste of the power and technology behind data-driven trading and investment analysis, an area that is normally the domain of professional investors in Japan.

- The primary objective of Numerai Signals is to search for original Signals
- Numerai Signals is composed of securities traded on exchanges around the world.
- Stocks in Japan are also part of the Numerai Signals
- At least 100 Signals are required to be submitted.

Numerai構成銘柄 (JP)

709 of the 5,181 issues (about 14%) are Japanese stocks
